CHEAT SHEET · KEEP IT NEXT TO YOUR LAPTOP

Three steps.
Then the agent guides you.

Answer in your own language. A number is enough as an answer.

1 Your own copy

Open github.com/AIAT-AIandBusinessgrowth/build-sessions-starter, signed in to GitHub. Click **Use this template** → **Create a new repository**, select **Private**, click **Create repository**, then **Code** → **Open with GitHub Desktop** → **Clone**. No GitHub: **Code** → **Download ZIP**, unzip it.

2 Open the folder

In the app: open the folder of your copy. In the terminal: go into the folder and type `claude` or `codex`.

3 Type `start`

The agent gets to know you, finds an idea with you, interviews you, writes a plan, builds a first version and checks it. It asks only one question at a time and gives you answers to choose from.

Words you can use any time

next	*go to the next step*
back	*do the last step again*
explain	*tell me what you just did, in two simple sentences*
check	*check the result against my plan*
where are we	*where are we, what is still missing*

Prefer Croatian? Use the Croatian starter and the Croatian version of this sheet.

Your level

The agent asks you about it. You can change at any time.

Level	Your goal for the afternoon
Level 1 · first time	A page with made-up data that shows your problem
Level 2 · I use chat AI	Your real file format with made-up values, plus a check against the plan
Level 3 · I build with agents	The agent proves with a test that it is right

When you get stuck

If you see this	Do this
The agent asks if it may run something	In your copy, "yes" is fine.
The agent goes in circles	Press Esc. Say in one sentence what you see and what you want.
You do not know where you are	Type `where are we`.
An error message	Copy it into the chat: "Fix this and explain it in one sentence."
Two repairs failed	New chat in the same folder, then `where are we`. Your files stay.
The agent says "save a version"	GitHub Desktop: type a short summary, click **Commit to main**, then **Push origin**.
A message about a usage limit	The message names the time. Until then, join your neighbour.
You cannot go on	Put a sticky note on your screen. A helper will come.

Rule one: only made-up data

No real names, customers, files from work, passwords or keys, not even in your private repository. Describing the columns is enough, the agent makes up the values. Why: personal AI subscriptions have no data processing agreement with your organisation.

Done means checked

A result can look finished and still be wrong. In the test, the agent expected seven overdue invoices when it read the data, but the page showed six. So always use `check`, and look for yourself.

After the workshop

Same folder. Open the agent, type `where are we`. The agent reads your plan and your notes and continues from there.

When the agent says "save a version": in GitHub Desktop type a short summary, click **Commit to main**, then **Push origin**. Your work is then in your private repository.

Last resort: empty folder. Create an empty folder, start the agent in it and write:

```
Help me build a small tool for my work today, step by step: get to know me, find an
idea with me, interview me, write a one-page PLAN.md, build a first version, check it.
One question at a time, with numbered example answers. Only made-up data. Build it as
one web page I can double-click. Install nothing. Keep every file in this folder.
```
